# How do you identify it?

# 94%

“94% of our AI submissions were undetected. The grades awarded to our AI submissions were on average half a grade boundary higher than that achieved by real students.”
Other research on detecting AI-written stories showed people’s judgement was worse than random guesses (39% correct). Confidence, time spent reading, self-reported experience with fiction all had no impact. Self-reported **experience with AI was the only thing that did predict success**.

# Sycophancy, verbosity, forced connections

*“In hindsight, I can definitely understand why XXX would not be the most useful source. I should’ve probably made that connection when researching their pros and cons. Nonetheless, I’m looking forward to learning more about them in lesson. It also makes sense that XXX sources would be more helpful in idea generation. I’ll certainly keep that in mind in the future.”*

# Restating, not developing

*"The choice of combining survey and interviews would help me align my research question with the appropriate tools of enquiry ...*

*"By using mixed methods approach, it will allow me to get a more comprehensive understanding of the research question ...*

*"This combination will strengthen the research as it will increase the reliability and validity of the findings ...*

*"The use of both methods shows an important methodological consideration. The survey would provide information by capturing general trends while interviews will give a more in-depth analysis by exploring personal experiences in detail."*

# Is there a tool we can use?

# Is there a tool we can use?

**No.**

# Checklist

# Linguistic red flags

- Links - check for `utm_source=chatgpt`
- **US spelling and style**, e.g. titlecase
- **Verbosity**: using more words, and longer words, than needed
- **Paragraphs very similar** in length and structure.
- Series of **three items**
- **Conjunctive adverb overload** (‘moreover’, ‘therefore’, ‘however’)
- **Wishy-washy** phrases ("it seems" or "one could argue")
- **Cliched fluff** ("When it comes to," "In today's world" etc)

# Structural & epistemic red flags

- **Tables, lists** and other structured content
- **Restating** rather than developing
- **Word count precision**
- **Restating, not developing** (circularity)
- **Disconnected** sections (e.g. literature in one section not used in another)
- **References** that don't exist and…
    - From unrelated disciplines
    - Inconsistencies between body and bibliography (including years)
    - Later theories attributed to earlier work
    - Overly canonical: AI predicts the most likely references
    - Domains: z-lib.org, zlibrary, libgen.is, library.lol, sci-hub, scribd.com, researchgate.net, academia.edu, other university pages/Moodles, publisher sample pages
    - 'Forced' attribution, e.g. using a reference to support something it doesn't
